

## Shared Screen

### Quick starter guide

#### 1) Control box

The control box contains two classic and one software specific function.

Left text element: This is the language setting. Here you can select another language manually.

Left icon: This minimizes the form.

Middle icon: This deletes your old session, including its latest screenshot and then a new access key will be generated.

Right icon: This deletes your latest session, including its latest screenshot and then SharedScreen will close.

#### 2) Access key

The access key is your temporary unique ID. If you share the access key other people can connect to your screen sharing session. If you click on the key icon, the access key will be copied to your clipboard.

#### 3) Screen selection

SharedScreen only uploads the selected screen. Viewers cannot switch the screen themselves. All screens shown will automatically refresh with a preview screenshot. This helps to identify your selection.

#### 4) Password lock and quality settings

If you want additional security, you can password protect the session. The password setting gets updated once you uploaded a new frame. This means if you stopped the screen sharing, the switched settings will not be active until you continued the session.

Additionally SharedScreen offers three quality settings:

- Low quality → 60% resolution; 50% quality level; additional pingo.exe compression
- Medium quality → 85% resolution; 75% quality level; additional pingo.exe compression
- High quality → 100% resolution; 90% quality level; additional pingo.exe compression

#### 5) Share screen access

This button allows you to share your screen with:

- A shortened link → Your viewers can directly see your screen content without entering your access key. If a password is set, they still have to enter the password.
- A manual link → Your viewers must enter your access key in order to see your screen content.
- QR code → Scan directly with your phone or export the QR code to your clipboard or disk

#### 6) State

The state label will always show you your latest action e. g. when you are ready to share your screen.

#### 7) Upload bandwidth

This UI element shows the average upload rate used by SharedScreen.

### What makes SharedScreen different?

There are quite a few problems when you simply want to share your screen:

- **The viewer needs an application on the same platform in order to see your screen:** SharedScreen works with any modern browser on Windows, Android and more, viewers do not require any additional application.
- **One or both users require an account:** Download, execute and run. Simply forget about login credentials or anything like this.
- **Too much access:** Only share what you really want to share. System information and other details are never shown. Do not worry about the viewer to secretly watch your other screens.
- **Data logging:** Do you really know what other companies do with your data? No? Use SharedScreen and be sure no data is analyzed or sold. Your screen is stored online for up to 10 minutes after its latest refresh. All old images are overwritten, so we store only one picture at the same time. Your access key is stored for 7 days until deletion.

After the deletion it may be reused. The key does not contain any sensitive information.

- **Limited screen share:** Instead of showing your screen with one person you can share your screen to an unlimited amount of people with or without password protection.

### Is there any disadvantage?

The only major issue is the slow frame rate.

### Privacy information

First of all, SharedScreen only uses the required information to host the screen sharing sessions. All data transmissions make use of modern encryption. We do not collect or analyze your data. Due to security reasons we temporarily store your IP address in a hashed form. This means the server uses your IP as a security check. We cannot “decrypt” your IP which is stored on our computer.

Your screenshot will be deleted after ten minutes or when you exit SharedScreen/generate a new access key. Our server only stores the latest screenshot and old ones will be securely overwritten and then deleted.

Assigned access keys and its assigned IP will be locked for one week. Our scheduled deletions will remove this information after exactly one week. There are no exceptions nor do we keep any data longer than 7 days.
